

Nofence

Grazing technology

Nofence is the first commercially sold virtual fencing solution for cattle, sheep and goat. With Nofence the herd is equipped with GPS collars combined with the Nofence application. The farmer draws boundaries in the application to create a pasture. When the animals cross the boundary they will receive an audio warning. If the animals don't turn around when the audio finishes playing they will receive an electric pulse. The animals learn to recognise the sound and avoid the pulse by returning.

After four year of commercial sale in Norway and with a few selected customers in the UK during the 2019 and 2020 season, Nofence will be commercially available in the UK starting in 2021.

Nofence App

Create virtual fences with the use of your fingertip and get an immediate status update from your animals. The App is available on both iOS and Android.

Easy to give access to healthy pastures

Exclude areas

Monitor your herds

Video of how Nofence works: <https://www.nofence.no/en/product-tour>

Oscar Hovde Berntsen is the founder and CTO of Nofence. He first got the idea of virtual fencing as a teenager, when he saw how restraining physical fencing was. In 2009 he started developing the system, and after many years of trialing the system finally worked. In 2020 Nofence has a system developed and commercially available for cattle, sheep and goats
